How an Enterprise Architecture Repository Works

A practical guide based on the Transitrix Methodology

Transitrix
transitrix.com

field/ — what you were told

Interviews, observations and drafts are source material, not established facts. Preserve who supplied them and when; keep the original and its provenance.

Contradictory accounts can coexist here. Do not silently turn a source statement into an admitted model fact.

codex/ — the authority you cite

External laws and regulations sit beside the organisation's own policies and standards. Preserve the issuing source faithfully.

Use these records to identify applicable obligations. Do not rewrite an authority document to make the model appear compliant.

canon/ — the admitted model

Processes, applications, goals and requirements have stable identities and explicit relationships. Record when each fact holds and how it was admitted.

Elements and relations are authoritative model state. Derived views live alongside canon in **views/**.

1. Propose the change

Use the repository's templates. Cite the evidence, identify affected elements and relations, and state what changes.

A tool may prepare candidates. Conversion and extraction do not establish truth or approval; check unsupported or uncertain inputs explicitly.

2. Validate, then review

Run the applicable checks and fix errors. Open a pull request so the team's authorised human reviewer can inspect the diff and evidence.

Validation is not approval. Admit the change only after the required review, checks and merge, and record who ran the gate.

3. Read the resulting views

Diagrams and reports answer questions about the model. Check the source revision and supported renderer; regenerate configured views when their sources change.

Keep the model and view definitions. An exported picture or PDF is a snapshot, not a promise of automatic refresh.

Optional analysis: a team may use **knowledge/** for sourced, dated interpretations awaiting model admission. It is not a fourth prescribed zone.

Team decisions: use **operations/decisions/** for why a choice was made, its status and alternatives. It sits beside the model; a problem in the modelled enterprise belongs in the model.
